New nucleic acid containing regulator and LHP gene of Mycobacterium tuberculosis - useful in vaccines, for diagnosis, and for expression of heterologous proteins

Ĥ

```
The present invention is directed to a polynucleotide carrying the regulatory expressions signals of the ESAT-6 protein as well as an open regulatory expression signals of the ESAT-6 protein as well as an open reading frame coding for an antigenic protein LHP from Mycobacterium tuberculosis. Host cells comprising the polynucleotide are used for the recombinant expression of the protein. The recombinant polypeptide can be used as immunogens and vaccines, to protect against bacteria of the M. tuberculosis complex in humans or animals (the vaccines may include other immunogenic proteins of the bacteria or their fragments, specifically ESAT-6); and (b) for diagnosing tuberculosis infection by detection of specific antibodies. The regulatory region present in the polynucleotide may be used to express almost any heterologous protein in mycobacteria, particularly as a fusion with polyhistidine. The two provide a synergistic increase in ability to induce a protective immune process. Sequences AAV03706-713 represent antigenic fragments of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention is directed to a polynucleotide carrying the regulatory expression signals of the ESAT-6 protein as well as an open reading frame coding for an antigenic protein LHP from Mycobacterium tuberculosis. Host cells comprising the polynucleotide are used for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ESAT-6 protein; antigenic protein; LHP; Mycobacterium tuberculosis; immunogen; vaccine; bacteria; tuberculosis; regulatory; synergistic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid containing reguid for and LHP gene of Mycobacterium tuberculosis – useful in vaccines, for diagnosis, and for expression of heterologous proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            M. tuberculosis LHP polypeptide antigenic fragment.

recombinant expression of the protein. The recombinant polypeptide can be used as immunogens and vaccines, to protect against bacteria of the M. tuberculosis complex in humans or animals (the vaccines may include other immunogenic proteins of the bacteria or their fragments, specifically ESAT-6); and (b) for diagnosing tuberculosis infection by detection of specific antibodies. The regulatory region present in the polynucleotide may be used to express almost any heterologous protein mycobacteria, particularly as a fusion with polyhistidine. The two proteins encoded by the polynucleotide, the and ESAT-6, are expected to provide a synergistic increase in ability to induce a protective immune response. Sequences AAY03706-713 represent antigenic fragments of the

This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequencan be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the

The present sequence represents a M.tuberculosis antigen, Tb38-1. The immunogenic polypeptide can be used to diagnose antigen, Tb38-1. The immunogenic polypeptide can be used to diagnose antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis.

New fusion proteins useful for diagnosis, prevention and treatment of tuberculosis
                                                                                                                                                                                                                This sequence represents the Mycobacterium tuberculosis antigen TD38-1. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens such as TD38-1, e.g. TDF-2 (see AAY32063) and a TB49-TD38-1 fusion. The new fusion proteins are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring more effective immunogens than mixtures of the individual protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions
                                                                                                                                                                                                                                                                                                                                                                                                                        Length 95;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mycobacterium tuberculosis; M. tuberculosis; antigen; immunimmunotherapy; diagnosis; immunisation; vaccine; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vedvick TS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ï
                                                                                                                                                                                                                                                                                                                                                                         This is an antigenic portion of Mycobacterium tuberculosis antigen TD38-1. A DNA sequence (see AAV44384) coding for antigen TD38-1 was isolated from a M. tuberculosis strain H37Rv expression ID18-TSY. The invention relates to compositions and methods for diagnosis. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigenic portion of as soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis

                                                                                                                                                                                                                                                                                                                                                  ij
                                The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion tuberculosis-immune subjects. AAZ19249 to AAZ19460 and AAX39083 to AAX39225 are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.
                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention describes polypeptides comprising an immunogenic are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion tuberculosis: Ag can induce proliferation of, or cytokine secretion tuberculosis-immune subjects. AAX19494 to AAX19460 and AAX39083 to AAX39225 are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antigen; diagnosis; detection; infection; antibody; immunisation;

It is encoded by genomic DNA isolated from a M. tuberculosis strain H37Rv genomic library using a probe derived from clone Tb38-1 (see AAV44384). The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, as well as DNA. sequences encoding such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immunogen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     tuberculosis antigen, as well as DNA sequences encoding such

                                                                                                                                                                                                                                                                                                                                                                                                                                                     XXX DEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention is directed to a polynucleotide carrying the regulatory expression signals of the ESAT-6 protein as well as an open reading frame coding for an antigenic protein LHP from Mycobacterium tuberculosis. Host cells comprising the polynucleotide are used for the recombinant expression of the protein. The recombinant polypeptide can be used as immunogens and vaccines, to protect against bacteria of the other immunogenic proteins of the bacteria of the interrulosis complex in humans or animals (the vaccines may include other immunogenic proteins of the bacteria or their fragments, specifically ESAT-6); and (b) for diagnosing tuberculosis infection by detection of specific antibodies. The regulatory region present in the polynucleotide may be used to express almost any heterologous protein in
                                                                      This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.
                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oţ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            These
mycobacteria, particularly as a fusion with polyhistidine. The two proteins encoded by the polynucleotide, LHP and ESAT-6, are expected to provide a synergistic increase in ability to induce a protective immune response. The present sequence represents the LHP polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences for members of the esat-6 gene family from Mycobacterium tuberculosis. Thes proteins include Rv0287, Rv1036c, Rv1037c, Rv2346c, Rv2348c, Rv2553c, Rv25654c, Rv33020c, Rv344c, Rv3445c, Rv3890c, Rv3891c, Rv3904c and Rv3905c. These can be used to produce vaccines against, and in the diagnosis of, tuberculosis (TB) infection. The present sequence is one
                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 2,

Sequence 2, Application US/08317223
Patent No. 5585267
GENERAL INFORMATION:
APPLICANT: Jones, Jonathan C.R.
APPLICANT: Quaranta, Vito
APPLICANT: Tamura, Richard
TITLE OF INVENTION: CELLULAR ATTACHMENT TO TRANS-EPITHELIAL
TITLE OF INVENTION: APPLIANCES
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS:
ADDRESSEE: Knobbe, Martens, Olson & Bear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COMPUTER READABLE FORM:

Sequence 18, Application US/08470179

Patent No. 564594

GENERAL INFORMATION:

APPLICANT: Huang Ph.D. Wai Mun

TITLE OF INVENTION: Method and Compositions for

TITLE OF INVENTION: Identification of Species in a Sample

NUMBER OF SEQUENCES: 207

CORRESPONDENCES: 207

CORRESPONDENCE ADDRESS:

ADDRESSEE: Trask, Britt and Rossa

STRET: U. Box 2550

CITY: Salt Lake City

Patent No. 5708147
GENERAL INFORMATION:
APPLICANT: Cybulsky, Myron I.
APPLICANT: Collins, Tucker
TITLE OF INVENTION: Endothelial Adhesion Molecule Associated With
TITLE OF INVENTION: Atherosclerosis
NUMBER OF SEQUENCES:
NUMBER OF SEQUENCES:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox
             Sequence 19, Application US/08470179
Patent No. 5645994
GENERAL INFORMATION:
APPLICANT: Huang Ph.D, Wai Mun
TITLE OF INVENTION: Method and Compositions for
TITLE OF INVENTION: Identification of Species in a Sample
NUMBER OF SEQUENCES: 207
CORRESPONDENCE ADDRESS:
ADDRESSE: Trask, Britt and Rossa
STRRET: P.O. Box 2550
CITY: Salt Lake City
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DB 1; Length 141;

# ALIGNMENTS

LETHOUGHT TO WEDIATE THE ATTACHMENT, WIGNATION OF CELLS INTO TISSUES DURING EMBRYONIC DEVELOPMENT BY INTERACTING WITH OTHER EXTRACELLULAR MATRIX COMPONENTS.

-!- FUNCTION: DIVERSE FUNCTIONS DURING MORPHOGENESIS IN DROSOPHILA.

COMPLETE LOSS-OF-FUNCTION MUTATIONS LEAD TO LATE EMBRYONIC
LETHALITY: CERRAIN PARTIAL LOSS-OF-FUNCTION MUTATIONS GIVE RAISE
TO ESCAPER ADULTS, WHICH HAVE ROUGH EYES ASSOCIATED WITH CHANGES
IN CELL FATE AND PATTERN, MISSHAPPEN LEGS AND DEFECTS IN WING
STRUCTURE.

-!- SUBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE
DIFFERENT POLIFEPTIDE GLAINS (ALPHA, BETA, GAMAA), WHICH ARE BOUND
TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE
COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.

-!- SUBCELLULAR LOCATION: EXTRACELLULAR; FOUND IN THE BASEMENT
MENBRARMS (MADOR COMPONENT).

-!- TISSUE SPECIFICITY: NEWLY FOUND MESODERM AND LATER PROMINENTLY
EXPRESSED IN HEMOCYTES, WHICH ALSO SYNTHESIZE COLLAGEN IV. 8888888888888888888888

Biochem. Biophys. Res. Commun. 200:844-851(1994).
-! FUNCTION: INVOLVED IN PROTEIN EXPORT. LIKELY PARTICIPATES IN
PROTEIN TRANSLOCATION ACROSS BUT THE CYTOPLASMIC AND THYLAKOID
MEMBRANES IN CYANOBACTERIAL CELLS.
-! SUBUNIT: HOMODIMER. PART OF THE PROKARYOTIC PROTEIN TRANSLOCATION
APPARATUS WHICH COMPRISE SECA, SECB, SECE, SECF, SECG
AND SECY (BY SIMILARITY).
-! SUBCELLULAR LOCATION: CYTOPLASMIC SIDE OF MEMBRANE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Biol. Chem. 272:11487-11494(1997).
-I- FUNCTION: UNWINDS DOUBLE-STRANDED DNA AND RNA IN A 3' TO 5' DIRECTION. GENERATES MULTIPLE SECONDARY STRUCTURES THAT INFLUENCE RNA-BINDING PROTEINS. MAY PLAY A ROLE IN X-LINKED GENE EXPRESSION.
-I- SUBCELLULAR LOCATION: NUCLEAR.
-I- SIMILARITY: BELONGS TO THE "DEAD" BOX FAMILY HELICASE. DEAH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -!- SIMILARITY: CONTAINS 2 DRBM (DOUBLE-STRANDED RNA-BINDING) DOMAINS.

Chem. 270:16422-16427(1995).
- FUNCTION: UNMINDS DOUBLE-STRANDED DNA AND RNA IN A 3' TO 5'
DIRECTION. GENERATES MULTIPLE SECONDARY STRUCTURES THAT INFLUENCE
RNA-BINDING PROTEINS. MAY LAX A ROLE IN X-LINKED GENE EXPRESSION.
- SUBCELLUTAR LOCATION: UNCLEAR.
- SIMILARITY: BELONGS TO THE "DEAD" BOX FAMILY HELICASE. DEAH
                                                                                                                                                                                                       NUCLEAR LOCALIZATION SIGNAL (POTENTIAL).

                                                                                                                                                                                                                                                                                       g
                                      The present invention is directed to a polynucleotide carrying the regulatory expression signals of the ESAT-6 protein as well as an open regulatory expression signals of the ESAT-6 protein as well as an open cading frame coding for an antigenic protein LHP from Mycobacterium tuberculosis. Host cells comprising the polynucleotide are used for the recombinant expression of the protein. The recombinant polypeptide can be used as immunogens and vaccines, to protect against bacteria of the M. tuberculosis complex in humans or animals (the vaccines may include other immunogenic proteins of the bacteria or their fragments, or specifically ESAT-6); and (b) for diagnosing tuberculosis infection by detection of specific antiboddes. The regulatory region present in the polynucleotide may be used to express almost any heterologus protein in mycobacteria, particularly as a fusion with polyhistidine. The two proteins encoded by the polynucleotide, LHP and ESAT-6, are expected to proteins encoded by the polynucleotide, LHP and ESAT-6, are expected to provide a synergistic increase in ability to induce a protective immune
